### Grouping Items

#### Why Group Things?
Grouping items together allows them to move together on the page. An example of when this can be useful is if you have labeled a shape on your page. If you want the label to stay on the shape when you move it, you have to group the shape and the label together.

#### How do I do it?

1. **Insert a square** onto the page. Click and choose the square.
2. Use the **text tool** to type the word "square".
3. Center the word square inside the shape. It should look something like this:
   ![Square](image)
4. To select multiple objects, use your select tool and draw an invisible box around the objects. Once you let go, you will see the marquee handles around all the items you selected.
5. Click the grouping button on the marquee handlebar, and then click anywhere on the page to deselect the shape.

**Now when you move the shape, the text will move too!**
