INTERACT Cheat Sheet

QR Codes

QR Audio Recording

## Adobe Flash Player Settings

Recordmp3 is a site that allows you to record audio on the site and gives you a web address where it is saved.

Visit **http://www.recordmp3.org/** and follow the directions on the screen to ensure the Adobe Flash Player settings are set properly.
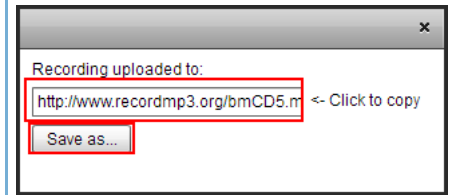

Recording Audio

If you are using a laptop it will have a built-in microphone. A desktop will require a microphone to plug into the computer.

Record your message. Use the "**Play**" button to review the recording. Then choose to "**Save Recording**" if you are happy with the recording or "**Start Over**" to re-record.

Acquiring the Link

After pressing "**Save Recording**" the file will be uploaded to the web. A new window will open that gives you the option to **Save the file** or **copy the link** where the file is saved online. Copy this link to use with a QR creator.

NOTE: If you are recording **multiple audio files**, we have found **you have to close the site and open it again** to start fresh. If you don't, the site stalls out.

Creating the QR Code

There are many sites that you can use to create QR Codes. We have had luck with **QRStuff.com**. It is quick and easy to use.

Open **http://www.qrstuff.com/** and follow these 4 easy steps.

1. **Data Type:** Choose what type of information you are sharing. In this case you will choose "**Website URL**".
2. **Content: Paste** the link you copied from Recordmp3.org here.
3. **Foreground Color:** Choose a color for your QR Code. A preview will appear to the right of this step. **Note: a darker color is better for scanning!**
4. **Output Type: Download** your QR code to use with your activity. Refer to the next page to learn how to print your QR Codes.
